

Project Structure:

Note: both `getWordLadderDFS` and `getWordLadderBFS` call the `makeDictionary()` function for their dict `HashSets<String>`

Tests:

1. Input: idiom dome, Expected result: no word-ladder found
2. Input: smart money, Expected result: `_`-rung ladder created
3. Input: abort about, Expected result: A 2-rung ladder created
4. Input: solodit Solomon, Expected result: 5 letter words only (repeated), I allow for the error message to be repeated in the console partially via a boolean called "breaker" which prevents a the message from potentially being repeated nearly infinitely; however since I cannot use `System.exit(0)`, I only put the return statements which are dependent on the boolean in half of the places I could've on order to preserve code readability.
5. Input: abort abort, Expected output: I 1-rung ladder exists
